

21.4.7 Reflection

You really did a great job filling out the rest of the pages using `useQuery` data. Thanks to React Router, this is starting to feel like a true multi-page app!

In this lesson, you accomplished the following:

- Used `Route` and `Switch` components to set up client-side routing.
- Used URL parameters in React Router for dynamic page content.
- Added variables to a `useQuery` Hook to run queries with arguments.

In the next lesson, you'll look at how to use GraphQL mutations and JWTs on the client side to finish up the `Login` and `Signup` components.

Lesson Code Snapshot

Download the [code snapshot](https://static.fullstack-bootcamp.com/module-projects/21-MERN/21.4.zip) (<https://static.fullstack-bootcamp.com/module-projects/21-MERN/21.4.zip>) for this lesson to compare with your own code. It's okay if your code isn't exactly the same—use this code snapshot as a starting point for the next lesson.
